

**Since 1995, Fat Cat Snappy Snares wires have been engineered for high performance, superior sound and long life. Now made of 90% carbon steel wire, attached to stainless steel end plates for the finest quality.**

## **Choosing the best style of Fat Cat Snare Wires**

One way of deciding which snare is best, can be determined by the depth of the snare bed on the drum. Some snare drums have little to no snare bed which will require choosing the **P** (Pitch) style end plate. This will work the best because when the Fat Cat is attached and fully tensioned, it will automatically force the snare wires into the bottom head resulting in minimal un-wanted rattling and maximum contact and sensitivity. Choose the **NP** (No Pitch) style end plate for snare drums with a deep cut snare bed. In this case, the deep bed is creating the contact and there is no need for the reverse angle on the end plate. Fat Cat endplates are designed to use both Cable or Strap with minimal off-set and can be used to attach to most standard throw-offs.

## **Installation:**

Always start by attaching to the butt side first. Keeping the snare wires evenly centered, equal distance from each side of the drum (when fully tensioned.) Make sure that the end plates are parallel with each other and not twisting, so as to not tension one side of the wires more than the other. This is very critical and will insure the highest performance and longest life. See below.

**YES**

**NO**

## **Warranty**

Snare wires will fatigue over time because of constant vibration. Fat Cat Snappy Snares have a 60 day limited warranty against manufacturers defects from the date of purchase. Failure to properly install with even and balanced tension or excessive tension, will void the warranty and may cause pre-mature breakage. For more information, go to:
